

# Category Service

---

## Curl commands

Requires the service to be running on localhost and port 8080. When working on the cluster, ensure that you port-forward the service to 8080.

### 1.Create a category

```
curl -i -XPOST -H"Content-Type: application/json" localhost:8080/category -d{"id": "100", "categoryName": "Transport", "description": "Taxi services"}
```

### 2.Get a category by ID

```
curl -i localhost:8080/category/100
```

### 3.Update a category by ID

```
curl -i -XPUT -H"Content-Type: application/json" localhost:8080/category/100 -d{"id": "100", "categoryName": "Transport", "description": "Paid Taxi services"}
```

### 4.List all category

```
curl -i localhost:8080/category
```

### 5.Delete a page by ID

```
curl -i -XDELETE -H"Content-Type: application/json" localhost:8080/category/100
```
